

Switch anti-barricade doorset operation

Operating instructions

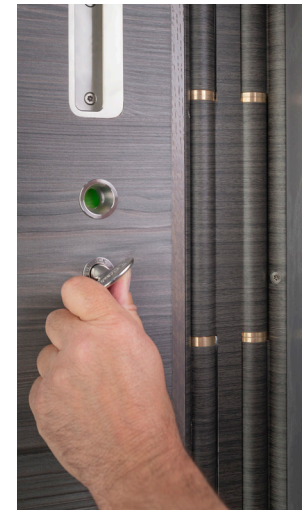

Step 1

Staff approach a barricaded door at the hinge side - the safe green zone, and observe the patient's room through the vision panel.

Step 2

Staff unlock the Switch hinge mechanism, while standing in the safe green zone.

Step 3

Switch lock mechanism and indicator shows a locked or unlocked state.

Step 4

Staff pull the door outwards using the handle provided, enabling the Switch mechanism to retract, allowing the door to open.

Step 5

The door safely opens outwards with staff stood in the safe green zone where the opening speed of the door is at it's slowest - the door provides a safe barrier between staff and the patient.

Step 6

The door opens outward even with lock bolt extended - meaning no need for time consuming and complicated override tool kits.
